(54) Method for etching smooth sidewalls in III-V based compounds for electro-optical devices

(57) III-V based compounds are etched to produce smooth sidewalls for electro-optical applications using BCl_3 together with chemistries of CH_4 and H_2 in RIE and/

or ICP systems. HI or IBr or some combination of group VII gaseous species (Br, F, I) may be added in accordance with the invention.

FIGURE 1B

FIGURE 1C

Description**BACKGROUND**

[0001] The etching of smooth sidewalls in III-V compounds is important for optical applications. Scattering loss in electro-optical devices is proportional to sidewall roughness. Hence, the performance of devices such as waveguides, microdisc resonators, photonic crystal waveguides and photonic crystal resonators depends on reduction of the sidewall roughness. Single mode ridge waveguides in InP and GaAs typically require dimensions on the order of 0.5 μm to maintain single mode performance as scattering losses from the waveguide surface are a large component of the propagation loss. Most work on etching III-V compounds such as InP for low loss waveguides has focused on $\text{CH}_4:\text{H}_2$ chemistry in standard reactive ion etch (RIE) systems. A feature of sidewalls produced in standard RIE systems is that the sidewalls are sloped. Some electro-optical devices require highly vertical sidewall geometries for improved device performance. For example, in photonic crystal lattices, it is important to provide highly vertical sidewall geometries to enable large photonic bandgaps for device performance.

Hence, it is desirable to have etch chemistries that enable highly vertical sidewall geometries with smooth sidewalls.

[0002] Inductively coupled plasma (ICP) etch systems typically produce a higher degree of vertical etches for most materials due to the increase in density of active species. However the chemistry selection still plays an important role in obtaining high aspect ratio etching. Typically, a $\text{CH}_4:\text{H}_2$ based chemistry is used for etching InP ; however, $\text{CH}_4:\text{H}_2$ based chemistry has difficulty etching very high aspect ratios.. Using chlorine based chemistry is problematic for obtaining high aspect ratio etching due to the highly reactive nature of chlorine. Recent work by Mirkarimi (see Attorney Docket No. 10030753) has shown the usefulness of using HBr: $\text{CH}_4:\text{H}_2$ chemistry to achieve deep etching in III-V compounds. However, the sidewalls of the etched III-V structure in some quaternary compositions such as InGaAsP exhibit rough sidewalls when using HBr: $\text{CH}_4:\text{H}_2$ chemistry.

SUMMARY OF INVENTION

[0003] BCl_3 additions chemistry is used to provide high aspect ratio etching together with smooth sidewalls. The BCl_3 additions improve the smoothness of the etched sidewalls and other surfaces. Optical losses on narrow waveguides have been typically reduced by a factor of 10 through the BCl_3 additions and typical etch rates of 370 nm/min can be achieved compared to etch rates of 35 nm/min using standard $\text{CH}_4:\text{H}_2$ based chemistry.

BRIEF DESCRIPTION OF THE DRAWINGS**[0004]**

FIGs. 1a-1c show steps for etching smooth high aspect sidewalls in accordance with the invention. FIG. 2 shows a graph indicating the change in propagation loss versus the percent by volume of BCl_3 in the etch in accordance with the invention. FIG. 3 shows a reactor capable of RIE and ICP mode in accordance with the invention. FIGs. 4a -4b show the effect of adding ICP mode in accordance with the invention.

15 DETAILED DESCRIPTION OF THE INVENTION

[0005] In accordance with an embodiment of the invention, appropriate mask layer 120 (see FIG. 1a), typically SiO_2 or Si_3N_4 is grown onto III-V epitaxial layer 110 or onto III-V substrate 105 of sample 100. Layer 130 is either photoresist or e-beam resist. Typical III-V materials are those that are combinations of Group III elements such as Al, Ga, In and B and Group V elements such as N, P, As and Sb. In accordance with the invention, the use of SiO_2 or Si_3N_4 mask 120 or other similar mask material offers etch selectivity between the mask material and the III-V material. The etch rate ratio of InP/ SiO_2 ranges from 20-50 depending on the etch conditions which is quite large. Chlorine Cl_2 based chemistries do not afford these types of etch ratios.. In FIG. 1b, mask layer 120 is defined by lithographic techniques such as direct write electron beam, standard contact lithography or other lithography appropriate for the desired feature size typically on the order of 1 μm on layer 130. Typically, the desired etch pattern is transferred into mask layer 120 using a dry etch technique such as CHF_3 in an RIE system. Sample 100 is then etched using either an RIE or inductively coupled plasma (ICP) system yielding a high aspect ratio structure with smooth sidewalls 115. In FIG. 1c, photoresist layer 130 is removed using a solvent bath followed by a high pressure (400mTorr) O_2 plasma clean..

[0006] In accordance with an embodiment of the invention, chemistries involving CH_4 , H_2 , HBr and BCl_3 are then used to transfer the lithographically defined features into III-V layer 110 or III-V substrate 105. The chemistries involving CH_4 , H_2 , HBr and BCl_3 provide the desired smooth etch by forming a passivation layer on sidewalls 150. The smoothness of sidewalls 150 in FIG. 1 may be estimated from scanning electron microscopy which then influences the propagation loss measurements. Note that in accordance with the invention HI or IBr or some combination of group VII gaseous species (Br, F, I) may be substituted for HBr. The iodine (I) will typically behave similarly with the bromine (Br) and form a lower volatility salt with indium (In) compared to, for example, chlorine (C1) and again form a passivation layer on sidewalls 150. Additionally in accordance with the

invention, BCl_3 may be used with H_2 and CH_4 such that the ratio of CH_4 to H_2 is greater than 1:1, for example 2:1, respectively.

[0007] In accordance with the invention, the etch chemistry is typically a combination of $\text{HBr}:\text{CH}_4:\text{H}_2:\text{BCl}_3$. In typical embodiments in accordance with the invention, the ratio of $\text{HBr}:\text{CH}_4:\text{H}_2$ is set to about 30:5:5 while BCl_3 may be adjusted up to about 50% by volume. Using ICP instead of RIE typically enhances the smoothness although, typically, significant reductions of surface roughness are achievable using RIE alone.

[0008] In an embodiment in accordance with the invention, the ratio of $\text{HBr}:\text{CH}_4:\text{H}_2$ is set to about 30:5:5 while BCl_3 is typically adjusted to about 33% by volume. Typically, propagation loss is significantly reduced for this embodiment along with the surface roughness of sidewalls 115. From graph 200 in FIG. 2, it is apparent that as the concentration of BCl_3 approaches about 33% by volume the propagation loss decreases, as the concentration of BCl_3 exceeds about 33% by volume the propagation loss increases as a consequence of increased surface roughness of sidewalls 115.

[0009] With reference to FIG. 3, typical values for reactor 305 in accordance with the invention are having radio frequency (RF) generator 310 typically operating at about 13.56 mHz and in the range 0-200 watts while having RF generator 320 typically operating at about 2 mHz and in the range 50-800 watts with reactor 305 at a pressure typically in the range 2-20 mTorr. Sample 100 is placed on heater 350. For InP based materials the temperature was set to 60°C although it is expected that the actual temperature may be higher during the etch. The temperature setting is determined by the material being etched and may be higher or lower for the other III-V materials under investigation.

[0010] RF generator 320 by providing inductively coupled plasma (ICP) power increases the number of ionized species and enables anisotropic etching with less damage to sidewalls 115 as is apparent from FIGs. 4a and 4b. FIG. 4a shows an electron micrograph of sidewalls 115 using RF generator 310 only resulting in a pure RIE etch. The ratio of $\text{BCl}_3:\text{HBr}:\text{H}_2:\text{CH}_4$ is set at 3:32:4:4 and BCl_3 is set at 7% by volume. FIG. 4b shows an electron micrograph of significantly smoother sidewalls 115 when using reactor 305 with ICP mode included so that both RF generator 310 and RF generator 320 are in use. The ratio of $\text{BCl}_3:\text{HBr}:\text{H}_2:\text{CH}_4$ is set at 3:32:4:4 and BCl_3 is set at 7% by volume.

[0011] In an embodiment in accordance with the invention, RF 310 is typically set at about 100 watts while RF 320 is typically set at about 400 watts at a typical pressure of about 5 mTorr in reactor 305. However, under these conditions the effective DC bias lies at about 350 volts. For some optical applications, this DC bias value may be too high causing etch damage due to the highly energized incoming ions. The DC bias is typically reduced by reducing RF 310 to values under 75 watts. Reduction in RF 1 reduces the DC bias while preserving

the smooth sidewall structure.

[0012] While the invention has been described in conjunction with specific embodiments, it is evident to those skilled in the art that many alternatives, modifications, and variations will be apparent in light of the foregoing description. Accordingly, the invention is intended to embrace all other such alternatives, modifications, and variations that fall within the spirit and scope of the appended claims.

10

Claims

1. A method for etching a III-V based compound comprising:
15 creating a mask on said III-V based compound; placing said III-V based compound and said mask into a reactor having a pressure between about 2 mTorr to about 20 mTorr; introducing a first gas chosen from HBr , HI , and IBr into said reactor; introducing a second gas of BCl_3 into said reactor; and
20 exposing said III-V based compound to a gas plasma comprising said first and said second gas to etch smooth high aspect ratio sidewalls.
2. The method of Claim 1 wherein said III-V based compound comprises indium.
30
3. The method of Claim 1 or 2 wherein said gas plasma is generated using a reactive ion etching system.
35
4. The method of Claim 1 or 2 wherein said gas plasma is generated using a combined reactive ion etching and inductively coupled plasma system.
40
5. The method of Claim 4 wherein a first radio frequency generator is operated in the range from about 0 to 200 watts and a second radio frequency generator is operated in the range from about 50-800 watts.
45
6. The method of any of Claims 1 to 5 wherein the concentration of said first gas is in the range from about 10 percent to about 75 percent by volume.
50
7. The method of any of Claims 1 to 5 wherein the concentration of said second gas is in the range from about 5 percent to about 75 percent by volume.
55
8. The method of any of Claims 1 to 7 further comprising introducing CH_4 and H_2 into said reactor.
55
9. The method of Claim 8 wherein the ratio of said CH_4 to said H_2 is in the range from 5:100 to 70:30.

10. The method of any of Claims 1 to 9 wherein said III-V based compound is heated to an initial temperature of about 60 °C.

11. A method for etching a III-V based compound comprising:

creating a mask on said III-V based compound;
placing said III-V based compound and said
mask into a reactor having a pressure between 10
about 2 mTorr to about 20 mTorr;
introducing a first gas chosen from group VII
gaseous species into said reactor;
introducing a second gas of BCl_3 into said re-
actor; and 15
exposing said III-V based compound to a gas
plasma comprising said first and said second
gas to etch smooth high aspect ratio sidewalls.

12. A method for etching a III-V based compound comprising:

creating a mask on said III-V based compound;
placing said III-V based compound and said
mask into a reactor having a pressure between 25
about 2 mTorr to about 20 mTorr;
introducing a first gas of BCl_3 into said reactor;
introducing a second gas of CH_4 ;
introducing a third gas of H_2 such that the ratio
of said third gas to said second gas is less than 30
one; and
exposing said III-V based compound to a gas
plasma comprising said first, second and third
gas to etch smooth high aspect ratio sidewalls. 35

13. The method of Claim 12 wherein the ratio of said second gas to said third gas is about 2:1.
